DEVELOPMENT KIT

**DESCRIPTION**

Accelnet AE2 is a dual-axis, high-performance, DC powered servo drive for position, velocity, and torque control of brushless and brush motors via EtherCAT, an Ethernet-based fieldbus. Using advanced FPGA technology, the AE2 provides a significant reduction in the cost per axis in multi-axis EtherCAT systems.

Each of the two axes in the AE2 operates as an EtherCAT slave using the CAN application layer over EtherCAT (CoE) protocol of DSP-402 for motion control devices. Supported modes include: Cyclic Synchronous Position-Velocity-Torque, Profile Position-Velocity-Torque, Interpolated Position Mode (PVT), and Homing.

Command sources also include  $\pm 10V$  analog torque/velocity/position, PWM velocity/torque, and stepper command pulses.

Feedback from a number of incremental and absolute encoders is supported.

Seventeen high-speed digital inputs with programmable functions are provided, and two low-speed inputs for motor temperature switches.

An SLI (Switch & LED Interface) function is supported by combining a high-speed input with four high-speed digital outputs. If not used for SLI, the input and outputs are programmable for other functions. Three open-drain MOSFET outputs can drive loads powered up to 24 Vdc.

An RS-232 serial port provides a connection to Copley's CME2 software for commissioning, firmware upgrading, and saving configurations to flash memory.

Drive power is transformer-isolated DC from regulated or unregulated power supplies. An AuxHV input is provided for "keep-alive" operation permitting the drive power stage to be completely powered down without losing position information, or communications with the control system.

## GENERAL SPECIFICATIONS

Test conditions: Load = Wye connected load: 2 mH + 2 Ω line-line. Ambient temperature = 25°C, +HV = HV<sub>max</sub>

MODEL	AE2-090-06	AE2-090-14	AE2-090-30	Units
<b>OUTPUT POWER (each axis)</b>				
Peak Current	6	14	30	A
	4.2	10	21.2	A
Peak time	1	1	1	s
Continuous current (Note 1)	3	7	15	A
	2.1	5	10.6	A
Maximum Output Voltage		Vout = HV*0.97 - Rout*Iout		RMS, sinusoidal
<b>INPUT POWER (module)</b>				
HVmin~HVmax	+14 to +90	+14 to +90	+14 to +90	V
Ipeak	12	28	30	A
Icont	6	14	15	A
Aux HV	+14 to +HV Vdc @ 500 mA maximum, 2.5 W			
<b>PWM OUTPUTS</b>				
Type	3-phase MOSFET inverter, 16 kHz center-weighted PWM, space-vector modulation			
PWM ripple frequency	32 kHz			
<b>CONTROL MODES</b>				
EtherCAT: CAN application layer over EtherCAT (CoE): Cyclic Synchronous Position/Velocity/Torque, Profile Position/Velocity/Torque, Interpolated Position (PVT), Homing				
Analog ±10 Vdc velocity/torque, 12-bit resolution				
Digital PWM velocity/torque and stepper position commands				
Discrete I/O: camming, internal indexer and function generator				
<b>COMMAND INPUTS</b>				
Type	EtherCAT, galvanically isolated from drive circuits			
Signals & format	TX+, TX-, RX+, RX-; 100BaseTX			
Data protocol	CAN application layer over EtherCAT (CoE)			
Device ID Selection	Programmable, or via digital inputs			
Analog	±10 Vdc, torque/velocity control			
Digital	High speed inputs for PWM velocity/torque and stepper/encoder position commands			
Camming	Quad A/B digital encoder			
<b>DIGITAL CONTROL</b>				
Digital Control Loops	Current, velocity, position. 100% digital loop control			
Sampling rate (time)	Current loop: 16 kHz (62.5 μs), Velocity & position loops: 4 kHz (250 μs)			
Commutation	Sinusoidal, field-oriented control for brushless motors			
Modulation	Center-weighted PWM with space-vector modulation			
Bandwidth	Current loop: 2.5 kHz typical, bandwidth will vary with tuning & load inductance			
HV Compensation	Changes in bus voltage do not affect bandwidth			
Minimum load inductance	200 μH line-line			
<b>ANALOG INPUTS</b>				
Number	2			
Type	±10 Vdc, 12-bit resolution, differential			
<b>DIGITAL INPUTS</b>				
Number, type [IN1~17]	18, 74LVC14 Schmitt trigger, V <sub>T+</sub> = 1.1~2 Vdc, V <sub>T-</sub> = 0.8~1.5 Vdc, V <sub>H+</sub> = 0.3~1.2 Vdc			
[IN18]	High-speed (HS) digital, 100 ns RC filter, 10 kΩ pull-up to +3.3 Vdc,			
	SLI port MISO input, 47 ns RC filter, 10 kΩ pull-up to +3.3 Vdc			
[IN19~20]	2, 74LVC2G14, V <sub>T+</sub> = 1.3~2.2 Vdc, V <sub>T-</sub> = 0.6~1.5 Vdc, V <sub>H+</sub> = 0.4~1.2 Vdc			
Functions	Motor temperature switch, 330 μs RC filter, 4.99 kΩ pull-up to +3.3 Vdc			
	Default functions are shown above, programmable to other functions			
<b>DIGITAL OUTPUTS</b>				
Number [OUT1~3]	7			
	Open-drain MOSFET with 1 kΩ pull-up with series diode to +5 Vdc			
[OUT4~7]	300 mA max, +30 Vdc max. Functions programmable			
	SLI port MOSI, SCLK, SS1, & SS2 signals, 74AHCT125 line drivers; +5 Vdc tolerant;			
Functions	Output current:-8 mA source @ V <sub>OH</sub> = 2.4V, 6 mA sink at V <sub>OL</sub> = 0.5V			
	Default functions are shown above, programmable to other functions			
<b>DC POWER OUTPUTS</b>				
Number	2			
Ratings	+5 Vdc, 400 mA max each output, thermal and short-circuit protected			
Connections	Axis A +5V Output: P3-17			
	Axis B +5V Output: P3-7			

### NOTES:

- 1) Heatsink or forced-air required for continuous current rating

**FEEDBACK (each axis)**

Incremental encoders:

Digital Incremental Encoder

Quadrature signals, (A, /A, B, /B, X, /X), differential (X, /X Index signals not required)  
 RS-422 differential line receivers, 5 MHz maximum line frequency (20 M counts/sec)  
 Fault detection for open/shorted inputs, or low signal amplitude, external 121Ω terminators required  
 Sin/Cos, differential, internal 121Ω terminators between ± inputs, 1.0 Vp-p typical, 1.45 Vp-p maximum,  
 Common-mode voltage 0.25 to 3.75 Vdc, ±0.25 V, centered about 2.5 Vdc  
 Signals: Sin(+), Sin(-), Cos(+), Cos(-),  
 Frequency: 230 kHz maximum line (cycle) frequency, interpolation 12 bits/cycle (4096 counts/cycle)

Absolute encoders:

 Heidenhain EnDat 2.2, SSI  
 Heidenhain EnDat 2.2

Serial Clock (X, /X), Data (S, /S) signals, differential 4-wire, external 121Ω terminator required for Data  
 Clock (X, /X), Data (S, /S), sin/cos (sin+, sin-, cos+, cos-) signals

Internal 121Ω terminators between sin/cos inputs, external 121Ω terminator required for Data

Absolute A, Tamagawa Absolute A, Panasonic Absolute A Format

SD+, SD- (S, /S) signals, 2.5 or 4 MHz, 2-wire half-duplex, external 121Ω terminator required  
 Position feedback: 13-bit resolution per rev, 16 bit revolution counter (29 bit absolute position data)

Status data for encoder operating conditions and errors

BiSS (B&amp;C)

MA+, MA- (X, /X), SL+, SL- (S, /S) signals, 4-wire, clock output from drive, data returned from encoder  
 External 121Ω terminator required for SL

*Commutation:*
*Encoder power*

Digital Hall signals, single-ended, 1.5 µs RC filter, 15 kΩ pull-up to +5 Vdc, 74LVC14 Schmitt trigger  
 (See DC POWER OUTPUTS section)

**RS-232 PORT**

Signals

RxD, TxD, Gnd for operation as a DTE device

Mode

Full-duplex, DTE serial port for drive setup and control, 9,600 to 115,200 Baud

Protocol

Baud rate defaults to 9,600 after power-on or reset. Programmable to 19,200, 57,600, 115,200  
 ASCII or Binary format

**MOTOR CONNECTIONS (each axis)**

Phase U, V, W

PWM outputs to 3-phase ungrounded Wye or delta connected brushless motors, or DC brush motors

Encoders

See FEEDBACK section above

Hall &amp; encoder power

See DC POWER OUTPUTS section

Motemp [IN19~20]

Motor overtemperature switch input. Active level programmable, 4.99 kΩ pull-up to +3.3 Vdc

Programmable to disable drive when motor over-temperature condition occurs

**PROTECTIONS**

HV Overvoltage

+HV > HV<sub>max</sub> Drive outputs turn off until +HV < HV<sub>max</sub> (See Input Power for HV<sub>max</sub>)

HV Undervoltage

+HV < +14 Vdc Drive outputs turn off until +HV > +14 Vdc

Drive over temperature

Heat plate > 70°C. Drive outputs turn off

Short circuits

Output to output, output to ground, internal PWM bridge faults

 I<sup>2</sup>T Current limiting

Programmable: continuous current, peak current, peak time

Motor over temperature

Digital inputs programmable to detect motor temperature switch

Feedback Loss

Inadequate analog encoder amplitude or missing incremental encoder signals

**MECHANICAL & ENVIRONMENTAL**

Size mm [in]

114 x 73 x 20.6 [4.5 x 2.9 x 0.8]

Weight

0.19 kg [0.42 lb] without heatsink, add 0.28 lb [.13 kg] for heatsink

Ambient temperature

0 to +45°C operating, -40 to +85°C storage

Humidity

0 to 95%, non-condensing

Vibration

2 g peak, 10~500 Hz (sine), IEC60068-2-6

Shock

10 g, 10 ms, half-sine pulse, IEC60068-2-27

Contaminants

Pollution degree 2

Environment

IEC68-2: 1990

Cooling

Heat sink and/or forced air cooling required for continuous power output

## COMMAND INPUTS

### ETHERCAT COMMUNICATIONS

EtherCAT is the open, real-time Ethernet network developed by Beckhoff based on the widely used 100BASE-TX cabling system. EtherCAT enables high-speed control of multiple axes while maintaining tight synchronization of clocks in the nodes. Data protocol is CAN application layer over EtherCAT (CoE) based on DSP-402 for motion control devices. More information on EtherCAT can be found on this web-site: <http://ethercat.org/default.htm>

### ETHERCAT CONNECTIONS

Page 11 shows guidelines for PC board layout and designing for EtherCAT signals.

Page 13 shows the dual EtherCAT cable connections on the Development Kit.

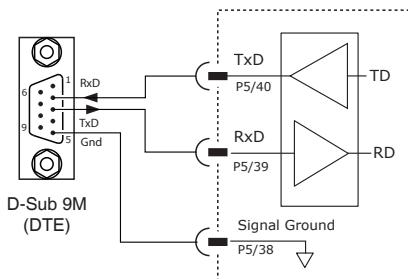

CME2 -> Basic Setup -> Operating Mode Options

Command Source: CAN over EtherCat

### RS-232 COMMUNICATIONS

AE2 is configured via a three-wire, full-duplex DTE RS-232 port that operates from 9600 to 115,200 Baud, 8 bits, no parity, and one stop bit. Signal format is full-duplex, 3-wire, DTE using RxD, TxD, and Gnd. Connections to the AE2 RS-232 port are through P2. The graphic below shows the connections between an AE2 and a computer COM port which is a DTE device.

### RS232 PORT

## ETHERCAT DEVICE ID (STATION ALIAS) SWITCHES

The SLI (Switch & LED Interface) port takes in the 8 signals from the two BCD encoded switches that set the EtherCAT Device ID and controls the LEDs on the EtherCAT port connectors.

The graphic below shows the circuit for reading the EtherCAT Device ID switches.

The 74HC165 works as a parallel-in/serial-out device.

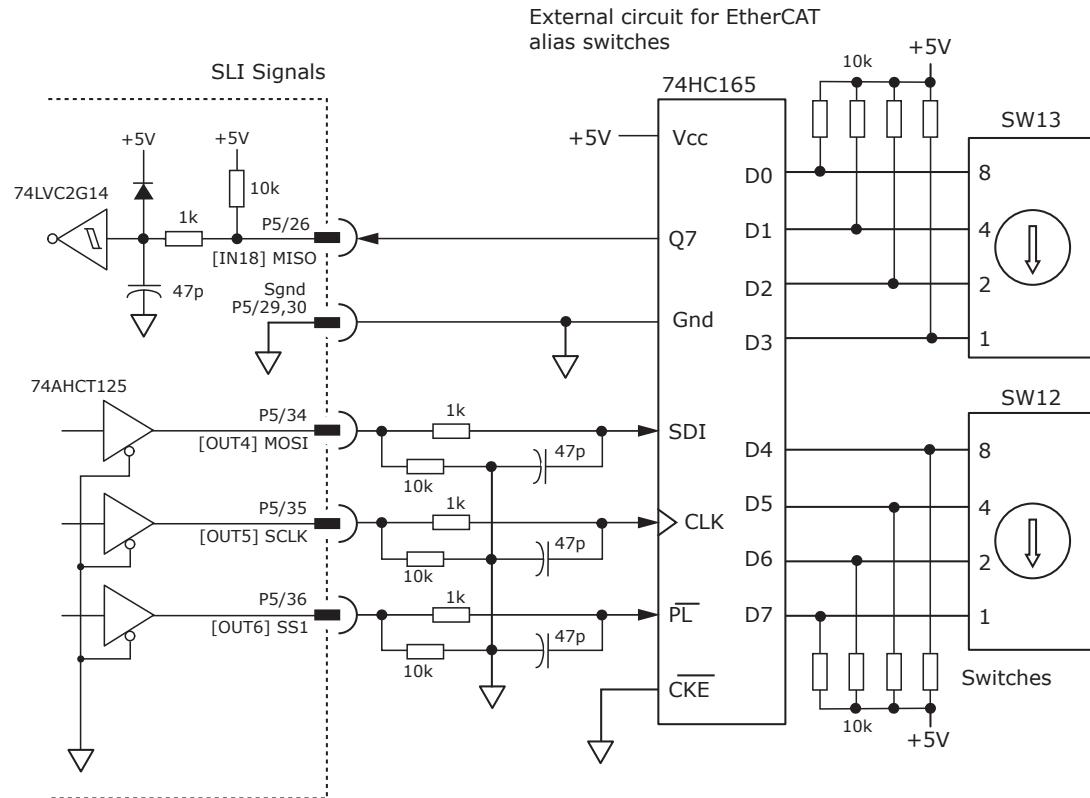

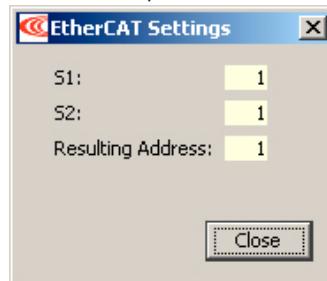

The 10k pull-down resistors pull the shift register inputs to ground when the AE2 is initializing.

In the graphics below, switch SW13 is "S2" and SW12 is "S1". The values of S1 are 16~255 and of S2 are 0~15. Together they provide Device ID range of 0~255.

CME2 -> Input/Output -> Digital Outputs

Use Switch and LED Interface (SLI)

CME2 -> Amplifier -> Network Configuration

## ETHERCAT 2-AXIS AND THE OBJECT DICTIONARY

Single-axis EtherCAT devices use objects in the range of 0x6000 to 0x67FF for standardized data that are read or written via the network as defined in CAN-CiA document CiA 301 *CANopen Application Layer and Communication Profile*. The AE2 appears as a single slave node on an EtherCAT network that contains two logical devices: Axis A, and Axis B. The standardized data objects for each is located in two sections of the object dictionary:

Axis A = 0x6000 to 0x67FF (the same range as single-axis devices such as the AE2 and AEP models)

Axis B = 0x6800 to 0xFFFF

Axis B objects correspond exactly to the objects for Axis A and can be addressed easily by adding 0x800 to the address of an Axis A object. E.g. 0x6060 Mode of Operation for Axis A is 0x6860 for Axis B.

## MOTOR CONNECTIONS

Motor connections consist of: phases, Halls, encoder, thermal sensor, and brake. The phase connections carry the drive output currents that drive the motor to produce motion. The Hall signals are three digital signals that give absolute position feedback within an electrical commutation cycle. The encoder signals give position feedback and are used for velocity and position modes, as well as sinusoidal commutation. A thermal sensor that indicates motor overtemperature is used to shut down the drive to protect the motor. A brake can provide a fail-safe way to prevent movement of the motor when the drive is shut-down or disabled.

### QUAD A/B INCREMENTAL ENCODER WITH FAULT PROTECTION

Encoders with differential line-driver outputs provide incremental position feedback via the A/B signals and the optional index signal (X) gives a once per revolution position mark. The MAX3097 receiver has differential inputs with fault protections for the following conditions:

*Short-circuits line-line:* This produces a near-zero voltage between A & /A which is below the differential fault threshold.

*Open-circuit condition:* The 121Ω terminator resistor will pull the inputs together if either side (or both) is open. This will produce the same fault condition as a short-circuit across the inputs.

*Low differential voltage detection:* This is possible with very long cable runs and a fault will occur if the differential input voltage is < 200mV.

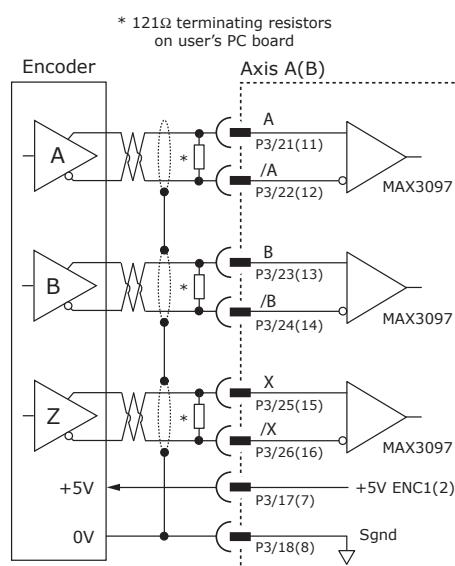

*±15kV ESD protection:* The 3097E has protection against high-voltage discharges using the Human Body Model.

*Extended common-mode range:* A fault occurs if the input common-mode voltage is outside of the range of -10V to +13.2V

If encoder fault detection is selected (CME2 main page, Configure Faults block, Feedback Error) and an encoder with no index is used, then the X and /X inputs must be wired as shown below to prevent the unused index input from generating an error for *low differential voltage detection*.

### SSI ABSOLUTE ENCODER

The SSI (Synchronous Serial Interface) is an interface used to connect an absolute position encoder to a motion controller or control system. The Accelnet drive provides a train of clock signals in differential format (Clk, /Clk) to the encoder which initiates the transmission of the position data on the subsequent clock pulses. The polling of the encoder data occurs at the current loop frequency (16 kHz). The number of encoder data bits and counts per motor revolution are programmable. Data from the encoder in differential format (Dat, /Dat) MSB first. Binary or Gray encoding is selectable. When the LSB goes high and a dwell time has elapsed, data is ready to be read again.

CME2 -> Motor/Feedback -> Feedback

### ENDAT ABSOLUTE ENCODER

The EnDat interface is a Heidenhain interface that is similar to SSI in the use of clock and data signals for synchronous digital, bidirectional data transfer. It also supports analog sin/cos channels from the same encoder. The number of position data bits is programmable. Use of sin/cos incremental signals is optional in the EnDat specification.

## DIGITAL HALL SIGNALS

Hall signals are single-ended signals that provide absolute feedback within one electrical cycle of the motor. There are three of them (U, V, & W) and they may be sourced by magnetic sensors in the motor, or by encoders that have Hall tracks as part of the encoder disc. They typically operate at much lower frequencies than the motor encoder signals, and are used for commutation-initialization after startup, and for checking the motor phasing after the servo drive has switched to sinusoidal commutation.

## HALL INPUTS

5V

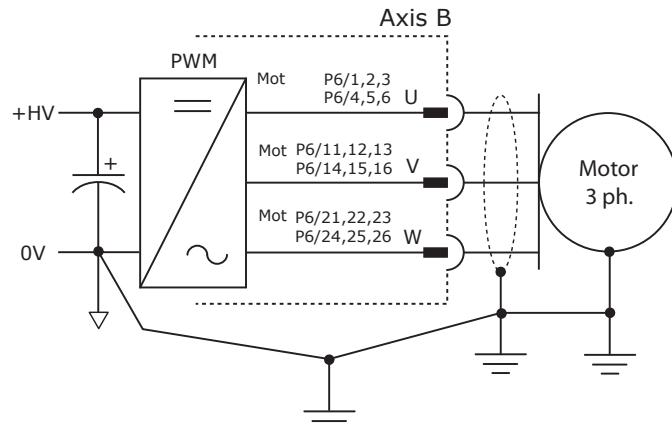

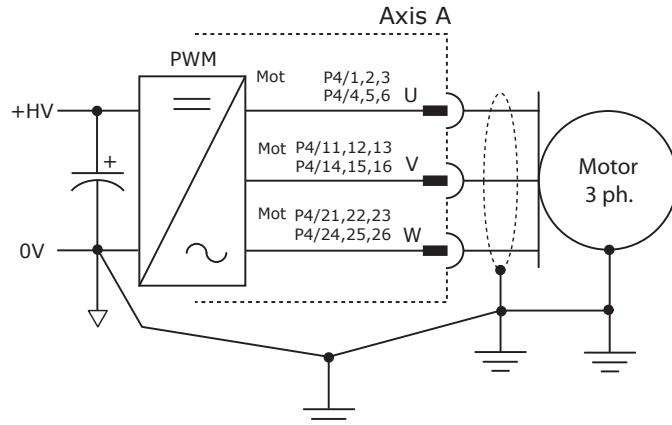

## MOTOR PHASE CONNECTIONS

The drive output is a three-phase PWM inverter that converts the DC bus voltage (+HV) into three sinusoidal voltage waveforms that drive the motor phase-coils. Cable should be sized for the continuous current rating of the drive. Motor cabling should use twisted, shielded conductors for CE compliance, and to minimize PWM noise coupling into other circuits. The motor cable shield should connect to motor frame and the drive HV ground terminal (J2-1) for best results. When driving a DC motor, the W output is unused and the motor connects between the U & V outputs.

CME2 -> Basic Setup -> Motor Options

Motor Family:
<input checked="" type="radio"/> Brushless <input type="radio"/> Brush

### MOTOR OVER TEMP INPUT

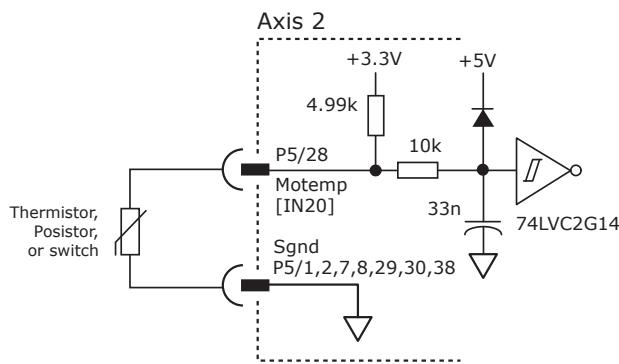

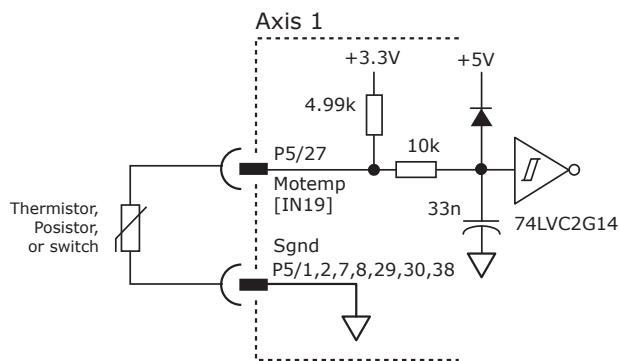

The 4.99k pull-up resistor works with PTC (positive temperature coefficient) thermistors that conform to BS 4999:Part 111:1987 (table below), or switches that open/close indicating a motor over-temperature condition. The active level is programmable.

Property	Ohms
Resistance in the temperature range 20°C to +70°C	60~750
Resistance at 85°C	≤1650
Resistance at 95°C	≥3990
Resistance at 105°C	≥12000

### COMMON CONNECTIONS FOR AXES A,B

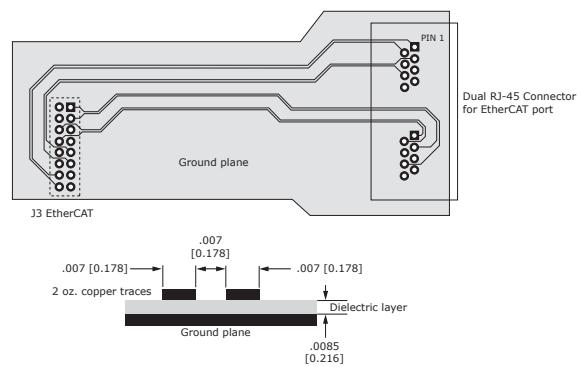

### ETHERCAT CONNECTIONS FOR MULTIPLE MODULES

### PRINTED CIRCUIT BOARD DESIGN FOR ETHERCAT SIGNALS

EtherCAT signal routing must produce a controlled impedance to maintain signal quality. This graphic shows some principles of PCB design that should be followed. Traces for differential signals must have controlled spacing trace, trace thickness, and spacing above a ground plane. All these things and the properties of the dielectric between ground plane and signals affect the impedance of the traces. The dimensions shown here are typical. The graphic on p. 4 detailing the EtherCAT connections shows resistors and a capacitor in the AE2 for terminating the unused conductors. As an alternative to adding traces back to the drive connector J3 for these signals, the same parts can be placed on the board at the RJ-45 connector, leaving only the differential EtherCAT signals to be routed with controlled impedance. When multiple modules are on a PCB these terminator signals are not daisy-chained and need only to connect to one set of R-C components at the RJ-45.

## DESCRIPTION

The Development Kit provides mounting and connectivity for one AE2 drive. Solderless jumpers ease configuration of inputs and outputs to support their programmable functions. Switches can be jumpered to connect to digital inputs 1~20 so that these can be toggled to simulate equipment operation. LED's provide status indication for the digital outputs, encoder A/B/X/S signals, and Hall signals. Test points are provided for these signals, too, making it easy to monitor these with an oscilloscope.

Dual EtherCAT connectors make daisy-chain connections possible so that other EtherCAT devices such as Copley's Accelnet Plus or Xenus Plus Ethercat drives can easily be connected. Rotary switches are provided to set the EtherCAT slave "station alias" Device ID.

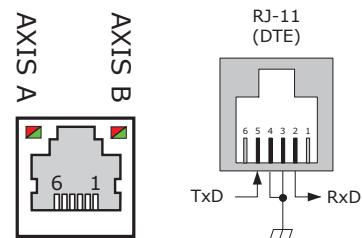

## RS-232 CONNECTION

The RS-232 port is used to configure the drive for stand-alone applications, or for configuration before it is installed into an EtherCAT network. CME 2™ software communicates with the drive over this link and is then used for complete drive setup. The EtherCAT Device ID that is set by the rotary switch can be monitored, and a Device ID offset programmed as well.

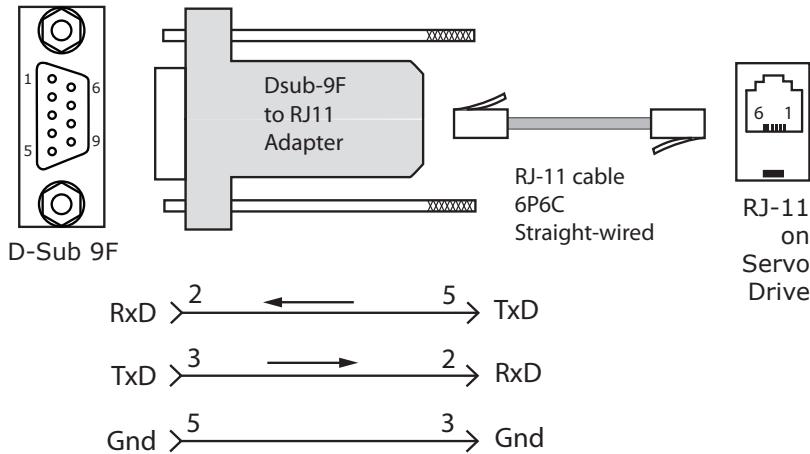

The RS-232 connector, J8, is a modular RJ-11 type that uses a 6-position plug, four wires of which are used for RS-232. A connector kit is available (SER-CK) that includes the modular cable, and an adaptor to interface this cable with a 9-pin RS-232 port on a computer.

## J8: SERIAL PORT

## SER-CK SERIAL CABLE KIT

The SER-CK provides connectivity between a D-Sub 9 male connector and the RJ-11 connector J8 on the Development Kit. It includes an adapter that plugs into the COM1 (or other) port of a PC and uses common modular cable to connect to the XEL. The connections are shown in the diagram below.

Don't forget to order a Serial Cable Kit SER-CK when placing your order for an AE2 Development Kit!

## ETHERCAT CONNECTIONS

Dual RJ-45 sockets accept standard Ethernet cables. The IN port connects to a master, or to the OUT port of a device that is 'upstream', between the Steynet and the master. The OUT port connects to 'downstream' nodes. If Steynet is the last node on a network, only the IN port is used. No terminator is required on the OUT port.

## ETHERCAT STAT LED

The bi-color STAT LED combines the functions of the RUN and ERR LEDs.

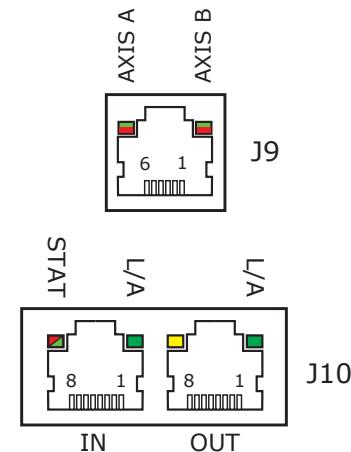

Green and red colors alternate, and each color has a separate meaning:

Green is the "RUN" or EtherCAT State Machine:	Red is the "ERR" indicator:
Off = INIT state	Blinking = Invalid configuration
Blinking = PRE-OPERATIONAL	Single Flash = Unsolicited state change
Single Flash = SAFE-OPERATIONAL	Double Flash = Application watchdog timeout
On = OPERATIONAL	

## L/A (LINK/ACT) LED

A green LED indicates the state of the EtherCAT network:

LED	Link	Activity	Condition
ON	Yes	No	Port Open
Flickering	Yes	Yes	Port Open with activity
Off	No	(N/A)	Port Closed

## AXIS LEDs

Two bi-color LEDs give the state of the AE2 axes. Colors do not alternate, and can be solid ON or blinking. When multiple conditions occur, only the top-most condition will be displayed.

When that condition is cleared the next one below will show.

- |                        |   |
|------------------------|---|
| 1) Red/Blinking        | = Latching fault. Operation will not resume until drive is Reset.   |
| 2) Red/Solid           | = Transient fault condition. Drive will resume operation when the condition causing the fault is removed. |
| 3) Green/Slow-Blinking | = Drive OK but NOT-enabled. Will run when enabled.  |
| 4) Green/Fast-Blinking | = Positive or Negative limit switch active.   |
| 5) Green/Solid         | = Drive OK and enabled. Will run in response to reference inputs or EtherCAT commands.                    |

### Latching Faults

- |   |   |
|---|---|
| Defaults  | Optional (programmable)   |
| <ul style="list-style-type: none"> <li>• Short circuit (Internal or external)</li> <li>• Drive over-temperature</li> <li>• Motor over-temperature</li> <li>• Feedback Error</li> <li>• Following Error</li> </ul> | <ul style="list-style-type: none"> <li>• Over-voltage</li> <li>• Under-voltage</li> <li>• Motor Phasing Error</li> <li>• Command Input Fault</li> </ul> |

## EtherCAT DEVICE ID

In an EtherCAT network, slaves are automatically assigned fixed addresses based on their position on the bus.

When a device must have a positive identification that is independent of cabling, a Device ID is needed. In the AE2 DevKit, this is provided by two 16-position rotary switches with hexadecimal encoding. These can set the Device ID of the drive from 0x01~0xFF (1~255 decimal). The chart shows the decimal values of the hex settings of each switch.

Example 1: Find the switch settings for decimal Device ID 107:

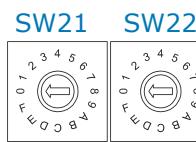

1) Find the highest number under SW21 that is less than 107 and set SW21 to the hex value in the same row: 96 < 107 and 112 > 107, so SW21 = 96 = Hex 6

2) Subtract 96 from the desired Device ID to get the decimal value of switch SW22 and set SW22 to the Hex value in the same row: SW22 = (107 - 96) = 11 = Hex B

**EtherCAT  
Device ID Switch  
Decimal values**

	SW21	SW@2
HEX	DEC	
0	0	0
1	16	1
2	32	2
3	48	3
4	64	4
5	80	5
6	96	6
7	112	7
8	128	8
9	144	9
A	160	10
B	176	11
C	192	12
D	208	13
E	224	14
F	240	15

CME2 -> Amplifier -> Network Configuration

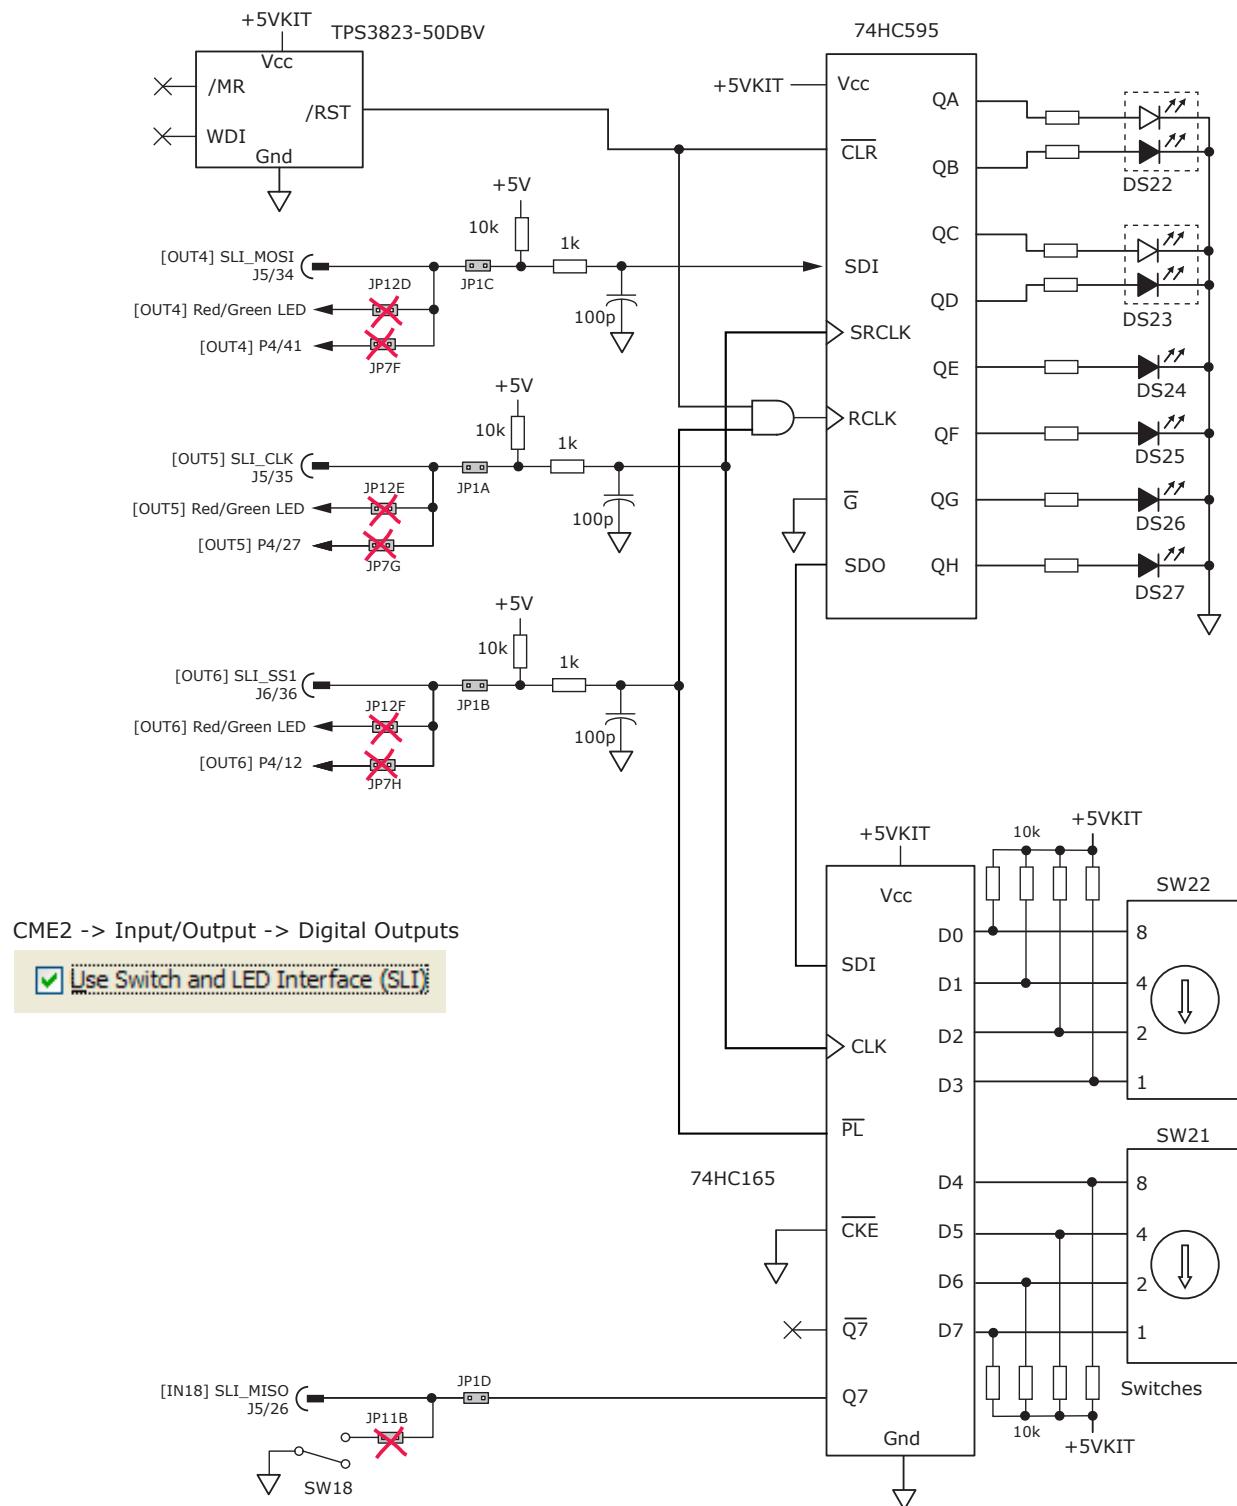

CME2 -> Input/Output -> Digital Outputs

### EtherCAT DEVICE ID (STATION ALIAS) SWITCH CONNECTIONS

The graphic below shows the connections to the EtherCAT Device ID switches and to the status LEDs for the AE2 and EtherCAT. The switches are read once after the drive is reset, or powered-on. When changing the settings of the switches, be sure to either reset the drive, or to power it off-on. Outputs [OUT4,5,6] and input [IN18] operate as an SLI (Switch & LED Interface) port which reads the settings on the EtherCAT Device ID switches, and controls the LEDs on the serial and EtherCAT port connectors.

The jumpers marked with red "X" should be removed so that SW18, or external connections to the signals do not interfere with the operation of the SLI port.

## 5V POWER SOURCES

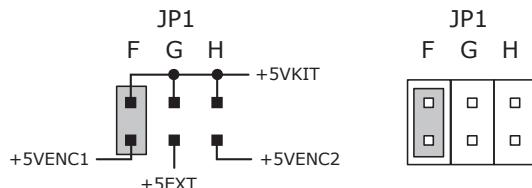

The feedback connectors J9 & J10 each have a connection to a +5V power supply in the AE2.

The signal name of Axis A power is +5VENC1, and for Axis B it is +5VENC2.

The components on the DevKit that drive the LEDs and read the Device ID switches are connected to the signal +5VKIT.

Jumpers on JP1 can connect these circuits to a choice of 5V power. These include either 5V supply in the AE2, or an external 5V power supply connected to J7.

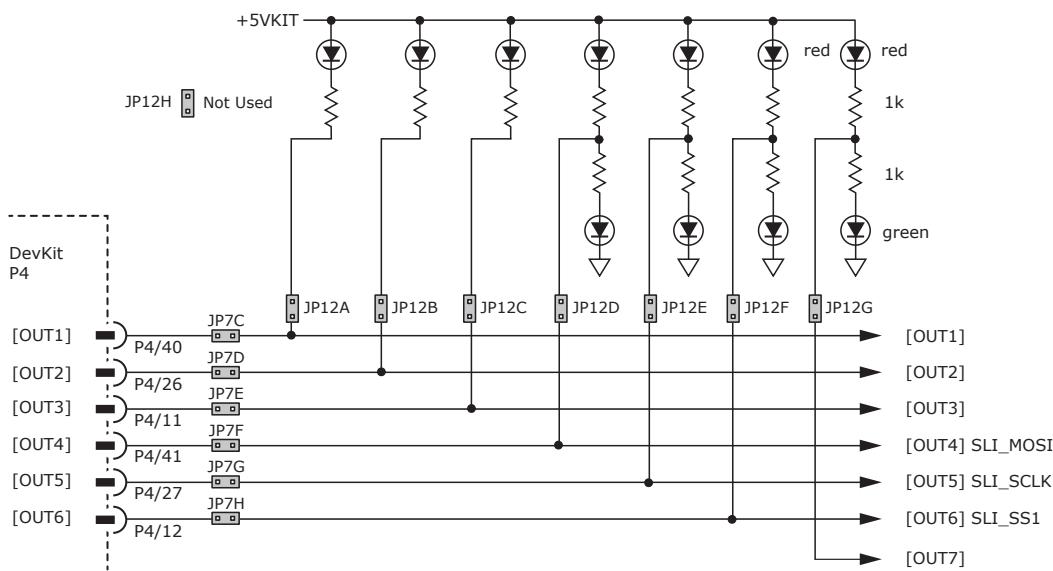

The graphic below shows the connections between +5VKIT and the other sources of 5V power.

**IMPORTANT: ONLY ONE SHORTING PLUG CAN BE USED ON JP1-F, G, OR H POSITIONS  
USE OF MORE THAN ONE PLUG WILL DAMAGE 5V POWER SUPPLIES IN THE AE2**

## LOGIC OUTPUTS

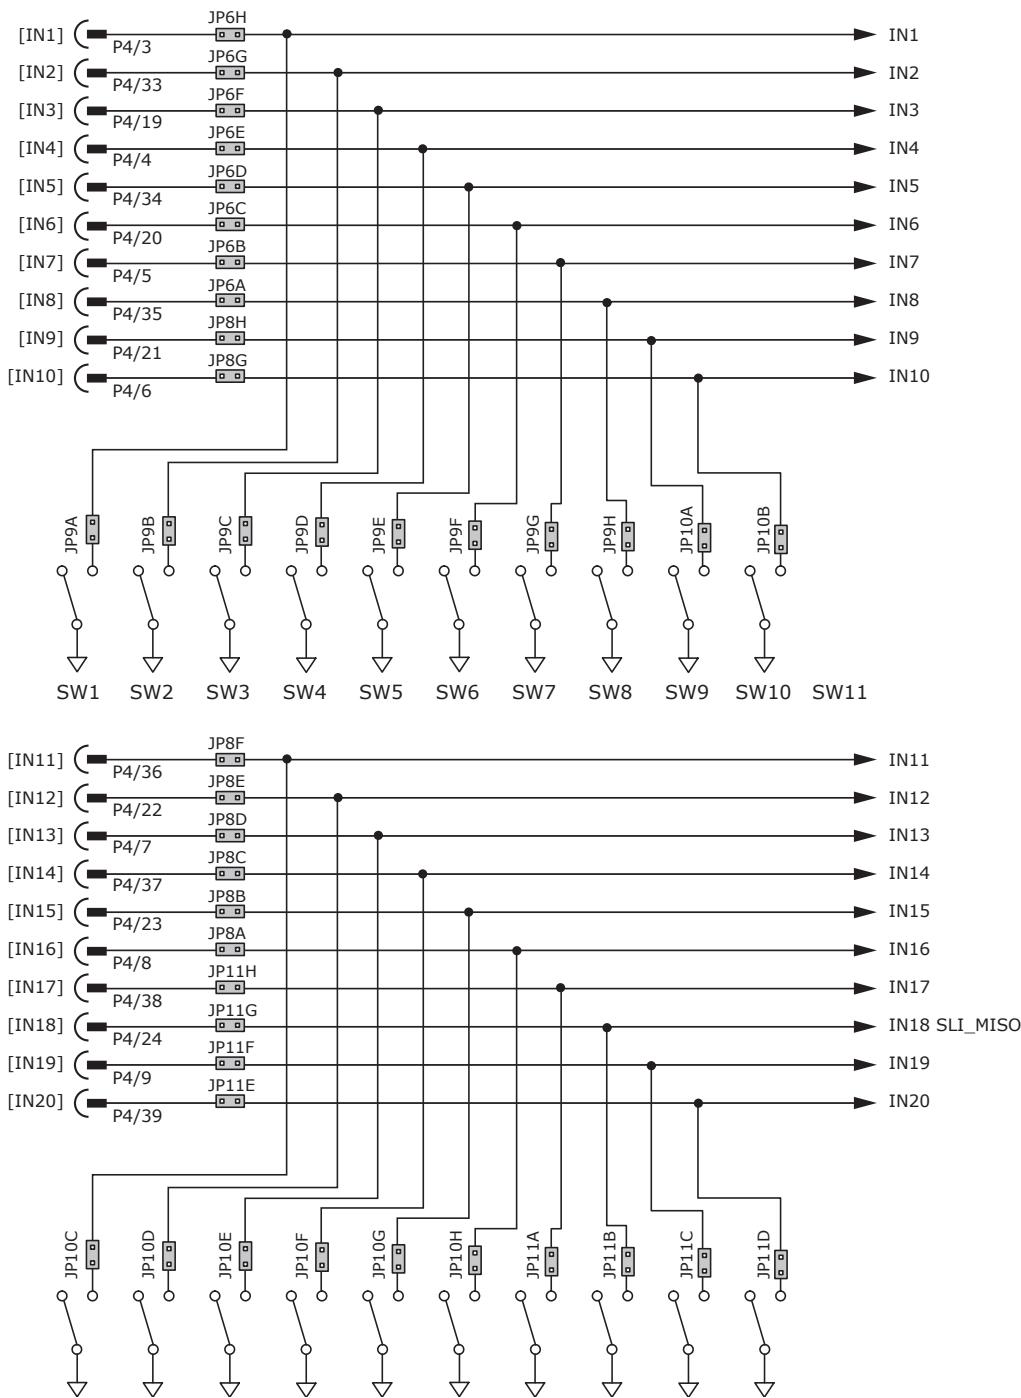

There are seven logic outputs that can drive controller logic inputs or relays. If relays are driven, then flyback diodes must be connected across their terminals to clamp overvoltages that occur when the inductance of the relay coil is suddenly turned off. Outputs 4,5,6 & 7 are CMOS types that pull up to 5V or down to ground. When these outputs go high it turns on the green LED. When they are low, the red LED is turned on. Outputs 1,2, & 3 are MOSFET types that sink current when ON, and appear as open-circuit when OFF. When these outputs are ON a red LED is turned on. When the outputs are OFF, the red LED is off. The green LED is not used on these outputs.

## LOGIC INPUTS &amp; SWITCHES

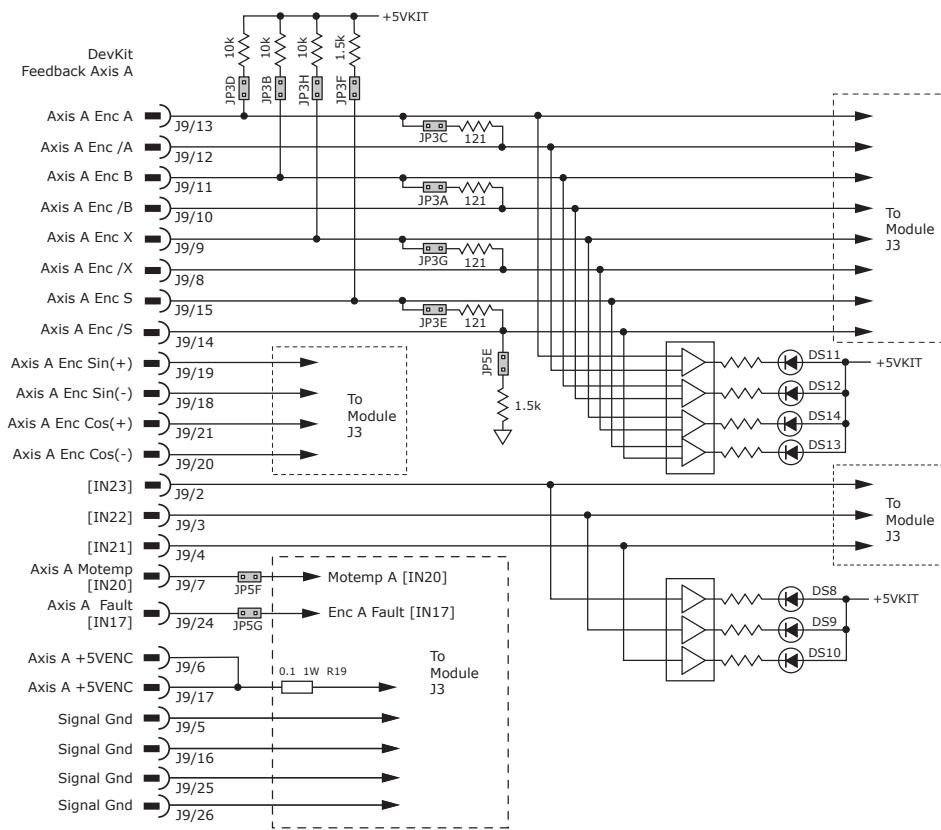

The Development Kit has jumpers that can connect the AE2 digital inputs to switches on the kit, or to the Signal connector J5. As delivered, all of these jumpers are installed as shown. If connecting to external devices that actively control the level of an input, it is desirable to disconnect the switch which could short the input to ground.

For example, if [IN1] is connected to an external device for the Enable function, then jumper JP9A should be removed to take the switch SW1 out of the circuit. The figure below shows these connections.

## THERMAL MANAGEMENT

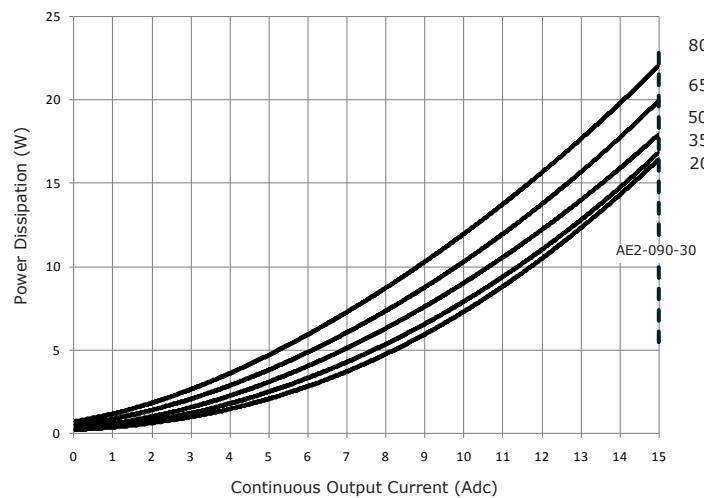

The charts on this page show the internal power dissipation for different models under differing power supply and output current conditions. The values on the chart represent the continuous current that one of the two axes would provide during operation. The +HV values are for the average DC voltage of the drive power supply.

When the total power dissipation is known the maximum ambient operating temperature can be found using different mounting and cooling means from the chart in Step 2.

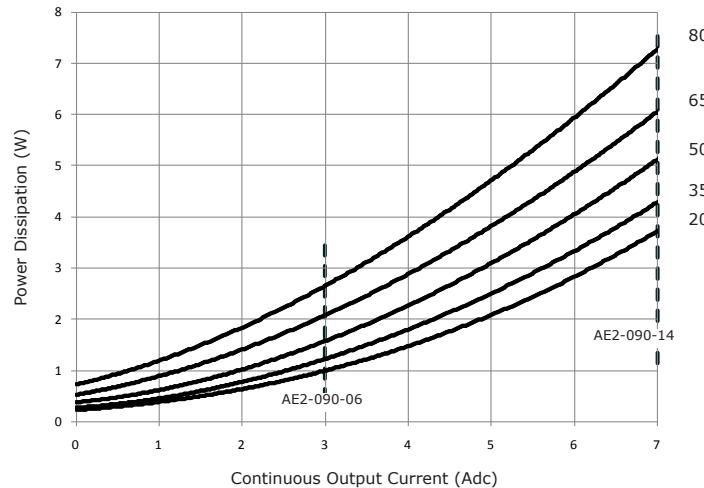

### STEP 1: FIND THE POWER DISSIPATION FOR EACH AXIS

Using the output current for an axis, find the power dissipation based on the HV power supply voltage. Add these to find the total power dissipation for Step 2.

AE2-090-30

AE2-090-06, AE2-090-14

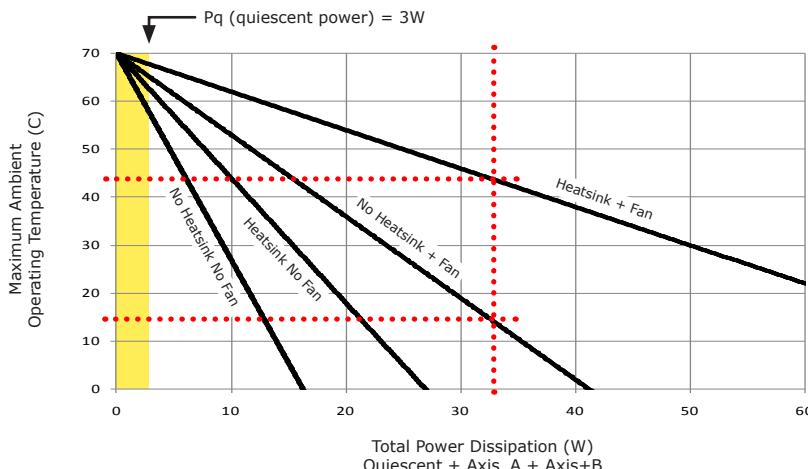

## STEP 2: FIND MOUNTING AND COOLING MEANS REQUIRED FOR DIFFERENT AMBIENT TEMPERATURES

Find the total power dissipation for the AE2 using the charts on the opposite page. Add the power for Axis A and Axis B, then add the quiescent power. Find a point on the X-axis of this chart for that power and draw a vertical line from it.

Draw a horizontal line from the point where the vertical line crosses the cooling condition lines.

Read the maximum ambient operating temperature where the horizontal line meets the Y-axis.

## HEATSINK OPTIONS

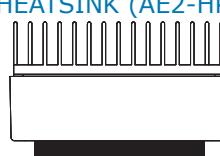

$R_{th}$  expresses the rise in temperature of the drive per Watt of internal power loss. The units of  $R_{th}$  are  $^{\circ}\text{C}/\text{W}$ , where the  $^{\circ}\text{C}$  represent the rise above ambient in degrees Celsius. The data below show thermal resistances under convection, or fan-cooled conditions for the no-heatsink, and AE2-HS heatsink.

### NO HEATSINK

AIR FLOW	C/W
CONVECTION	4.3
FORCED AIR (300 LFM)	1.7

### HEATSINK (AE2-HK)

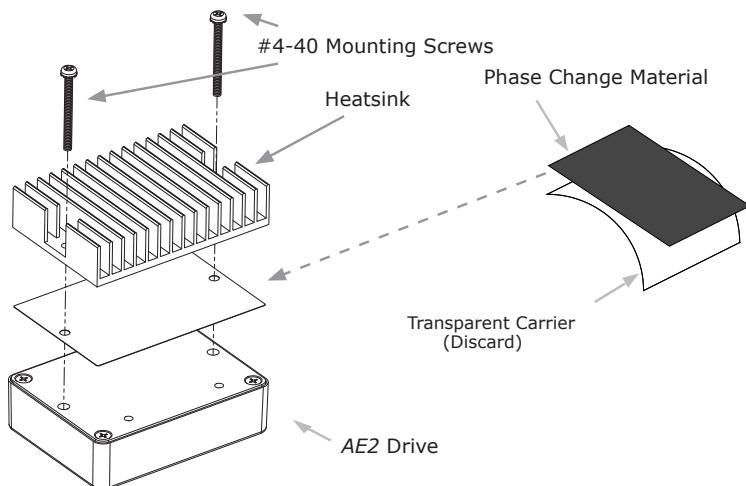

AIR FLOW	C/W
CONVECTION	2.6
FORCED AIR (300 LFM)	0.8

## HEATSINK INSTALLATION

The heatsink is mounted using the same type of screws used to mount the drive without a heatsink but slightly longer. Phase change material (PSM) is used in place of thermal grease. This material comes in sheet form and changes from solid to liquid form as the drive warms up. This forms an excellent thermal path from drive heatplate to heatsink for optimum heat transfer.

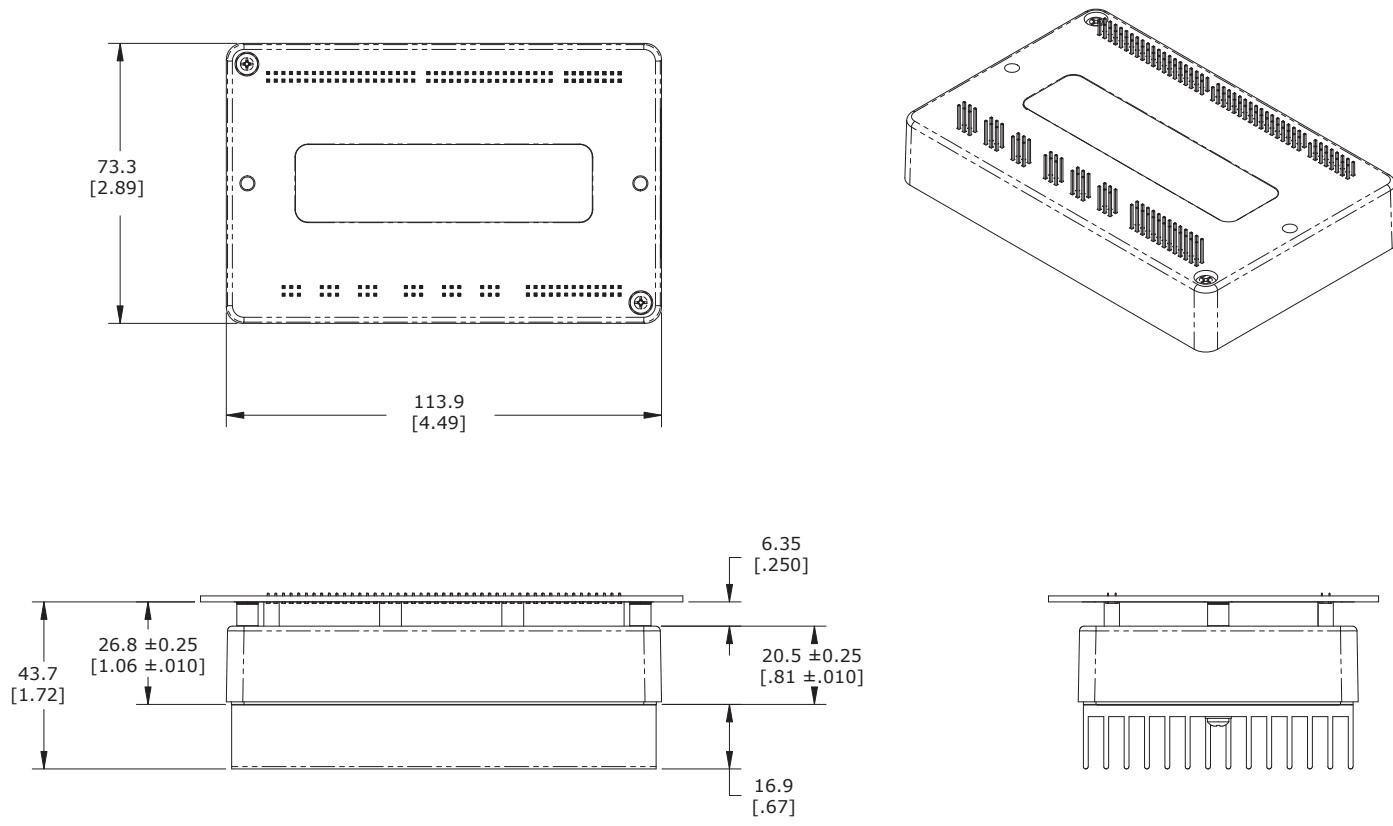

### STEPS TO INSTALL

1. Remove the PSM (Phase Change Material) from the clear plastic carrier.
2. Place the PSM on the Accelnet aluminum heatplate taking care to center the PSM holes over the holes in the drive body.
3. Mount the heatsink onto the PSM again taking care to see that the holes in the heatsink, PSM, and drive all line up.
4. Torque the #4-40 mounting screws to 3~5 lb-in (0.34~0.57 N·m).
